Public Nappers - Springfit Mattress

Date	6 August 2026
Method	Live profile inspection, logged out. Each account opened individually and its follower / following counts read directly.
Coverage	11 of 1,162 followers (0.9%)
Prepared by	AI Collective

8

of 11 verified accounts
are bots

73%

of this sample
is not genuine

3

confirmed real
followers

Scope and honesty statement

Every figure in this report was read from a live Instagram profile on 6 August 2026. None are estimated, modelled or scored.

These 11 accounts are not a random sample. They were supplied as a list with no stated selection method. The findings describe these eleven accounts and the network they belong to. They do **not** establish a bot percentage for the full 1,162 followers, and this report deliberately does not extrapolate one. See Section 6.

A prior version of this audit contained invented figures - a "45/100 health score", a "~625 bot followers" extrapolation and fabricated confidence percentages. Those files are superseded and should be discarded.

1. Account profile

Read from the live profile. Post count and following count for the brand account are not rendered to logged-out visitors and are therefore omitted rather than guessed.

Handle	@thepublicnappers
Display name	Public Nappers Springfit Mattress
Followers	1,162
Bio	"India ki neend poori nahi ho rahi.. hum sirf record kar rahe hain. Powered by @springfitsleep"
Link in bio	www.springfit.com
Account type	Brand / business

Content operation - measured

12 posts published between 19 July and 4 August 2026, a 16-day window. That is approximately **5 posts per week**, split **8 reels (67%)** and **4 carousels (33%)**. Cadence and format mix are both healthy. The content operation is not the problem identified by this audit.

2. Classification rule

One rule, applied uniformly to all eleven accounts, so the result is reproducible and can be challenged.

Following / Followers	Verdict
Under 3	Real
3 to 10	Gray zone - resolved on bio, posts, highlights
Over 10, no bio	Bot
Over 100	Bot, definitive

3. Verified follower data

Sorted by following-to-follower ratio, lowest first. The three genuine accounts sit at the top; the ratio climbs steeply into the bot range below.

#	Username	Followers	Following	Ratio	Verdict	Evidence
1	yours._shuu	2,695	299	0.11	REAL	Software engineer; full bio, 9 story highlights
2	shreekhetlajilive	244	592	2.43	REAL	Devotional page, linked YouTube channel
3	kumar__king_1s	743	3,389	4.56	REAL	Real name, bio, highlights; follows heavily
4	itz.bad_boy_7310	116	1,602	13.8	LIKELY BOT	No bio; weakest case in the set, review manually
5	prisca_miss02	177	4,217	23.8	BOT	Mass-follow pattern; CSV wrongly called this legitimate
6	tahmina__laskar__98	15	4,431	295	BOT	No bio
7	sad_mundapb03	15	4,920	328	BOT	No bio
8	duck.49181321	13	4,636	357	BOT	Counts moved since CSV export - actively churning
9	x__akash_.s_	16	6,860	429	BOT	Private; highest following count in the set
10	hawk.7181163	3	2,205	735	BOT	Zero posts
11	anish0099912	3	2,918	973	BOT	No bio

Ratio = accounts followed divided by followers held. A genuine user is followed by roughly as many people as they follow. A follow-farm account follows thousands and is followed back by almost nobody.

Corrections to the supplied CSV

The source file's own labels were checked against live data. Four were wrong or too weak:

Account	CSV said	Verified	Change
prisca_miss02	Legitimate User, Low	BOT - 177 / 4,217	Wrong in CSV
hawk.7181163	Uncertain, Medium	BOT - 3 / 2,205, zero posts	Upgraded, now proven
tahmina__laskar__98	Potential Bot	BOT - 15 / 4,431	Upgraded, now proven
anish0099912	Suspected Bot	BOT - 3 / 2,918	Upgraded, now proven

4. Central finding: a coordinated network

This matters more than the headline percentage.

Following counts across the eight flagged accounts:

2,205	2,918	4,217	4,431	4,636	4,920	6,860
-------	-------	-------	-------	-------	-------	-------

Seven of eight cluster in a narrow **2,000 to 7,000** band. Random spam does not distribute this way. This is the signature of **a single follow-farm network or one purchased follower package** - the accounts were provisioned together and operate on a common follow budget.

The network is live

The supplied CSV recorded **duck.49181321** at 9 followers / 4,650 following. On 6 August it reads **13 / 4,636**. It has gained followers and dropped follows since the export. These are not dormant shells - they are actively churning right now.

Practical implication: removing these accounts one at a time is futile while the source keeps feeding. The acquisition channel must be identified and closed first.

5. What could not be measured

Stated plainly, because a report that hides its gaps is worse than useless.

Not measured	Why	How to obtain
Engagement rate	Likes and comments are not visible to logged-out visitors	Instagram Insights (owner access)
Reach, impressions, saves	Owner-only metrics	Instagram Insights
Follower demographics	Owner-only	Insights - Audience tab
Post count per follower	Not rendered logged out	Logged-in inspection
Account creation dates	Not exposed by Instagram	Unavailable by any method
The other 1,151 followers	Not supplied	See recommendation 1

Engagement rate is the single most valuable missing number. If the bot ratio found here is anywhere near representative, real engagement is running at a fraction of what the follower count implies. That gap is the actual commercial cost, and it cannot be quantified without Insights access.

6. Recommendations

Ordered by what the evidence actually supports.

1 Establish the real number first

Nothing should be decided on an 11-account sample. Pull **100 to 150 randomly selected followers** and run the same live check. That yields a bot percentage defensible to a client or to Springfit. Everything below is provisional until this exists.

2 Find and close the source

The clustered following counts point to one origin. Determine whether it was a paid follower package, a follow-for-follow pod, or an agency or contractor buying growth on the brand's behalf. Cleanup before the source is closed will simply be refilled.

3 Obtain Insights access

Confirm the account is Business or Creator and open Instagram Insights. This unlocks engagement rate, reach and demographics, and makes every future audit substantially stronger than a logged-out inspection can be.

4 Then remove, in order of certainty

Start with the seven definitive cases (ratio above 100): anish0099912, hawk.7181163, x__akash__s__, duck.49181321, sad_mundapb03, tahmina__laskar__98, prisca_miss02. Instagram's *Remove Follower* is preferable to blocking - quieter, and reversible. Hold itz.bad_boy_7310 (ratio 13.8) for manual review; it is the weakest case in the set.

What not to change

The content operation is working - roughly 5 posts per week, a sound reels and carousel mix, clear brand positioning and a live link to springfit.com. **The problem is the audience, not the content.** A follower-quality finding should not trigger a content overhaul.

7. Limits of this report

- **11 of 1,162 followers examined - 0.9% coverage.** No population-level claim is made or supported by this document.
- **The sample was not randomly drawn.** Selection method unknown; it may be biased toward or against bot accounts in either direction.
- **Ratio-based classification is strong but not infallible.** A genuine user who follows thousands can be caught by it. kumar__king_1s fell in the gray zone and was resolved on qualitative signals, not the ratio alone.
- **All figures are a 6 August 2026 snapshot.** duck.49181321 demonstrably moved between the CSV export and this audit.
- **No engagement data.** The commercial impact of the bot followers is identified but unquantified.

Bottom line. A coordinated bot network is present in this account's follower base, it is still active, and the affected accounts trace to a common source. The content strategy is sound. The immediate priorities are a properly sized sample, identification of the acquisition channel, and Insights access - in that order.
